# PRILIMINARY DESIGN ANALYSIS AND RC MODELLING OF A REGIONAL AIRLINER 

## GUTTAPALLI SAVARNI MAHARSHI*

#### Abstract

This project is design analysis and modelling of a regional airliner or commuter aircraft. This project serves to work out the preliminary design and develop computer aided design (CAD) to fabricate a radio controlled (RC) model. Project starts with application of aircraft design process on a commuter class aircraft in which synthesized knowledge in subjects like aerodynamics, structures, propulsion and performance etc. is required. Most of the geometric parameters which drive the aircraft design will be obtained inpreliminary design process. By these parameters Computer Aided Design (CAD) modelis developed in CATIA V5 R19 software.From the Computer Aided Design (CAD) database, design calculationslike center of gravity, neutral point and static margins etc. are carried out. Light weight polystyrene foam board, Radio controlled electronics are used to fabricate model.

Key words: preliminary design, wing loading, CATIA V5, RC Modelling.

[^0]Volume 5, Issue 10

## INTRODUCTION

The process of design of a device or a vehicle, in general involves the use of knowledge in divers fields to arrive at a product that will satisfy requirements regarding functional aspects, operational safety and cost. The design of an airplane, which is being dealt in this paper, involves synthesizing knowledge in areas like aerodynamics, structures, propulsion, systems and manufacturing techniques. The design of an aircraft is a complex engineering task follows as shown in fig. 1

Fig.1: Detailed overview of aircraft design
Preliminary design starts with the assumption of a wing loading that satisfies the selected aircraft class either from previous records or by present relative aircrafts. Three fundamental aircraft parameters that are determined during the preliminary design phase are: Aircraft maximum take-off weight (WTO), Wing reference area ( $\mathrm{S}_{\mathrm{W}}$ or $\mathrm{S}_{\text {ref }}$ or S ), and Engine thrust (TE or T ) or engine power ( PE or P ). These three parameters will govern the aircraft size, the manufacturing cost, and the complexity of Preliminary Design calculation. A few other aircraft parameters such as aircraft zero-lift drag coefficient and aircraft maximum lift coefficient are estimated in this phase too. In some references, this process and this design phase is referred to as "initial sizing". This is due to the nature of the process which literally determines the size of three fundamental features of the aircraft.

Fig.2: Preliminary design approach

## Preliminary Design of a Regional Airliner

## Requirements:

- Gross Still Air Range (GSAR):2000km
$\square$ No. of passengers: 60
V Cruise Mach number: 0.35~0.4
$\boxtimes$ Service celling (or) operating altitude: 8000m. Or 26247 ft .
$\boxtimes$ Power plants: turbo prop engines are chosen as they are efficient in the speed regimes between 0.3~0.5

## Preliminary weight estimation:

No of passengers and range plays a key role in weight estimation. In this case aircraft was considered to carry 60 passengers

Gross Still Air Range (GSAR):2000km or 1250nm (for this GSAR the safe range will be around 1400 km )

1 cabin crew should be assigned for 30 passengers so we have 2 cabin crew in present case. Including flight crew (captain \& first officer) total crew will be 4 members

$$
\text { Total=passengers }+ \text { crew }=60+4=64 \text { members }
$$

${ }^{\circ}$ As per aircraft regulation allowable passenger weight is 110 kgf ( 82 kg passenger weight with carry-on baggage +28 kgf check-in baggage)

Therefore payload weight will be

$$
64 \times 110=7040 \mathrm{kgf}=69038.816 \mathrm{~N}
$$

The gross weight $W g=\frac{W p a y+W c r e w}{1-\left(\frac{W f}{W g}\right)+\left(\frac{W e}{W g}\right)}$

From other relevant aircrafts the " $\mathrm{W}_{\mathrm{g}}$ " is taken approximately as 21500 kgf and From previous aeronautical research data we can approximate these values for present case

- Aspect ratio: 12
- Taper ratio: 0.5
- Swept back: $0^{0}$
- $\mathrm{W} / \mathrm{S}=350 \mathrm{kgf} / \mathrm{m}^{2}$

From these values,

$$
\mathrm{S}=\mathrm{W}_{\mathrm{g}}\left(\frac{\mathrm{~s}}{\mathrm{~W}}\right)=21500 \times\left(\frac{1}{350}\right)=61.43 \mathrm{~m}^{2}
$$

## Wing parameters:

Wing span: $b \sqrt{=S A}=\sqrt{12 \times 61.43}=27.15 \mathrm{~m}$
Root chord: $\mathrm{C}_{\mathrm{r}}=\frac{2}{(1+\lambda)} \times \frac{s}{b}=\frac{2}{1+0.5} \times \frac{61.43}{27.15}=3.02 \mathrm{~m}$
Tip chord: $\mathrm{C}_{\mathrm{t}}=\mathrm{C}_{\mathrm{r}} \times \lambda=3.02 \times 0.5=1.51 \mathrm{~m}$

## Revised weight estimation:

$$
W g=\frac{W p a y+W c r e w}{1-\left(\frac{W f}{W g}\right)+\left(\frac{W e}{W g}\right)}
$$

## Estimation of empty weight fraction:

 2015$$
\text { We have the equation } \frac{W e}{W o}=\mathrm{A} \cdot \mathrm{~W}_{\mathrm{o}}{ }^{\mathrm{c}}
$$

Where $\mathrm{W}_{\mathrm{o}}=$ takeoff gross weight, ' A ' \& ' c ' are values depending on aircraft type
In this case for "twin turbo prop" so, $\mathrm{A}=0.92 \& \mathrm{c}=-0.05$ (from Ref. 1 table 3.1)

$$
\frac{W e}{W o}=0.92\left(2.202 \mathrm{~W}_{\mathrm{g}}\right)^{-0.05}
$$

## Fuel fraction:

The fuel weight depends on the mission profile and the fuel required as reserve. The mission profile for a civil transport aircraft involves:
$>$ Take off
$>$ Climb
$>$ Cruise
$>$ Loiter before landing
$>$ Descent
> Landing

## Takeofif

Fig.3: Simple cruise mission of transporter aircraft

## Warm-up, taxi \& takeoff:

The weight of the airplane at the start of take-off is $\mathrm{W}_{0}$ and the weight of the airplane at the end of the take-off phase $W_{1}$. The ratio $\left(\frac{W 1}{W 0}\right)$ is estimated using the guidelines given in Ref 1

2015

ISSN: 2249-0558

$$
\frac{W 1}{W 0}=0.98
$$

## Climb:

The weight of the airplane at the start of climb is $\mathrm{W}_{1}$ and the weight of the airplane at the end of the climb phase is $\mathrm{W}_{2}$. The ratio $\left(\frac{W 2}{W 1}\right)$ for this phase isestimated by following guidelines given in Ref 1

$$
\frac{W 2}{W 1}=0.99
$$

## Cruise:

The weight of the airplane at the start of cruise is $W_{2}$ and the weight of the airplane at the end of the cruise phase is $W_{3}$. The ratio $\left(\frac{W 3}{W 2}\right)$ for the cruise phase of flight is calculated using the following expression from

$$
\frac{W 3}{W 2}=\exp \left(\frac{-R * B S F C}{3600 \eta p\left(\frac{L}{D}\right)}\right)
$$

$>$ The safe range $=1334 \mathrm{~km}$
$>$ For turbo prop driven aircrafts $\left(\frac{L}{D}\right)_{\max }=\left(\frac{L}{D}\right)_{\text {cruise }}=16$
> Allowing additional distance covered due to head wind of $15 \mathrm{~km} / \mathrm{hr}$. (say) and Provision for diversion to other airport in an emergency
$>$ Service celling is at 262470 ft . at M0.35
Speed of sound at 8 km or $26247 \mathrm{ft} . \mathrm{a}=\sqrt{\gamma \mathrm{RT}}$
at 8 km altitude temperature $=236.23 \mathrm{k}$
Pressure $=3.5651 \mathrm{~N} / \mathrm{m}^{2}$
Density $=5.2578 \mathrm{~kg} / \mathrm{m}^{3}$
Speed of sound $\overline{\mathrm{a}}=\sqrt{1.4 \times 236.23 \times 287}$

$$
\mathrm{a}=308.1 \mathrm{~m} / \mathrm{s}
$$

2015

$$
\mathrm{V}_{\text {cruise }}(\mathrm{u})=108 \mathrm{~m} / \mathrm{s}\left(\text { Mach number }=\frac{u}{a}\right)
$$

Time to cover cruise range of 1334 km at $\mathrm{V}_{\mathrm{cr}}=389 \mathrm{~km} / \mathrm{hr}$. is $\frac{1334}{389}=3.34$ hours
A head wind of $15 \mathrm{~m} / \mathrm{s}$ or $54 \mathrm{~km} / \mathrm{hr}$ additional distance will be $54 \times 3.34=180.4 \mathrm{~km}$
Allowance for diverging airport=300km

$$
\text { Distance }=180.4+300=480.4 \mathrm{~km}
$$

Total distance $\mathrm{R}=1300+480.4=1780.4 \mathrm{~km}$
BSFC is taken as $0.5 / \mathrm{hr}$.
Substituting the values in equation

$$
\frac{W 3}{W 2}=\exp \left(\frac{-1780.4 * 0.5}{3600 * 0.8 * 16}\right)=0.98
$$

## Loiter:

$$
\frac{W 4}{W 3}=\exp \left(\frac{-E \times B S F C \times V}{1000 \times \eta p \times\left(\frac{L}{D}\right)}\right)
$$

$>$ Loiter endurance is taken as 30 minutes
$>$ For turboprop $\left(\frac{L}{D}\right)_{\text {loiter }}=0.866\left(\frac{L}{D}\right)=0.866 \times 16=13.85$
$>\operatorname{BSFC}=0.6^{*} \eta \mathrm{p}=0.8$

$$
\frac{W 4}{W 3}=\exp \left(-0.5 \times 0.5 \times \frac{389.1}{1000} \times 0.8 \times(13.85)=0.99\right.
$$

Landing:from Ref. 1 table 3.2

$$
\frac{W 5}{W 4}=0.995
$$

* Total $=0.98 \times 0.99 \times 0.98 \times 0.99 \times 0.95=\mathbf{0 . 8 9 4}$

Allowing reserve fuel of $6 \%$

$$
\text { Fuel fraction }=\frac{W f}{W g}=1.06\left(1-\frac{W 5}{W 0}\right)=1.06(1-0.894)=0.112
$$

## Gross weight $\left(\mathbf{W}_{\mathrm{g}}\right)$ :

$$
W g=\frac{\text { Wpay }+ \text { Wcrew }}{1-\left(\frac{W f}{W g}\right)+\left(\frac{W e}{W g}\right)} \text { so, } \quad \mathrm{W}_{\mathrm{g}}=\frac{7040}{1-0.112-0.92(2.202 W g)-0.05}
$$

## Iteration method:

Table1: Gross weight

Estimation of Wing
Thrust Loading $\left(\frac{T}{W}\right)$ :
Estimation of wing
loading is based on

| $\mathbf{W}_{\mathbf{g}}$ | $\mathbf{W}_{\mathbf{e}} / \mathbf{W}_{\mathbf{0}}$ | $\mathbf{W}_{\mathbf{g}}$ |
| :---: | :---: | :---: |
| $\mathbf{2 1 0 0 0}$ | 0.537694 | 20096 |
| $\mathbf{2 0 5 0 0}$ | 0.538343 | 20134 |
| $\mathbf{2 0 2 5 0}$ | 0.538673 | 20153 |
| $\mathbf{2 0 1 8 0}$ | 0.538766 | 20159 |
| $\mathbf{2 0 1 6 0}$ | $\mathbf{0 . 5 3 9 7 9 3}$ | $\mathbf{2 0 1 6 0}$ |

## iterations

Loading $\left(\frac{W}{S}\right)$ and
loading and thrust various considerations

## Landing distance consideration:

From aeronautical charts the balanced field length for such weight is taken as 1250 m

$$
\mathrm{S}_{\text {land }}=1250 \mathrm{~m}
$$

From ramyer ${ }^{1}$ text $\mathrm{C}_{\mathrm{Lmax}}$ of single slotted flap is 2.2

$$
\begin{gathered}
\mathrm{W}=\mathrm{L}=\frac{1}{2} \rho \mathrm{~V}_{\text {stall }}^{2} S C_{\mathrm{Lmax}} \\
\left(\frac{W}{S}\right)=\frac{1}{2} \rho \mathrm{~V}_{\text {stall }}^{2} C_{\mathrm{Lmax}}
\end{gathered}
$$

Approach velocity $\mathrm{K}_{4}=\widetilde{\text { Sland }} \frac{0.3}{0.3}$

$$
\begin{gathered}
\mathrm{V}_{\mathrm{a}}=1.3 \mathrm{~V}_{\mathrm{s}} \& \mathrm{~V}_{\mathrm{td}}=1.15 \mathrm{~V}_{\mathrm{s}} \\
\mathrm{~V}_{\mathrm{a}}(\text { in knots })=\sqrt{ } \frac{4101}{0.3}=116.91 \mathrm{kts}=51.96 \mathrm{~m} / \mathrm{s} \\
\text { Stall speed } \mathrm{V}_{\mathrm{s}}=\frac{\mathrm{Va}}{1.3} \\
\mathrm{~V}_{\mathrm{s}}=\frac{51.96}{1.3}=39.96=40 \mathrm{~m} / \mathrm{s} \\
\left(\frac{W}{S}\right)=\frac{1}{2}(1.2250) * 40^{2} * 2.2=2156 \mathrm{~N} / \mathrm{m}^{2}
\end{gathered}
$$

For such airplanes $\mathrm{W}_{\text {land }}=0.85 \mathrm{~W}_{\text {takeoff }}$

$$
\left(\frac{W}{S}\right)_{\mathrm{TO}}=\frac{1}{0.85}\left(\frac{W}{S}\right)_{\operatorname{land}}=\frac{1}{0.85}(2156)=2536.4 \mathrm{~N} / \mathrm{m}^{2}
$$

* Allowing $\pm 10 \%$ variation in $\mathrm{V}_{\text {stallgives }} 2371.6 \mathrm{~N} / \mathrm{m}^{2}<\left(\frac{W}{S}\right)<2790 \mathrm{~N} / \mathrm{m}^{2}$

## Maximum speed considerations $\mathbf{V}_{\text {max }}$ :

Maximum velocity is decided on bases of Mach number.

$$
\mathrm{M}_{\max }=\mathrm{M}_{\text {cruise }}+0.04==0.4+0.04=0.404 * 308.1=124.4724 \mathrm{~m} / \mathrm{s}
$$

The drag polar is alternatively given by

$$
\begin{gathered}
\mathrm{C}_{\mathrm{D}}=\mathrm{F}_{1}+\mathrm{F}_{2} \mathrm{P}+\mathrm{F}_{3} \mathrm{P}^{2} \\
\text { Where } \mathrm{F} 1=\mathrm{C}_{\mathrm{fe}}\left(1+\frac{S h t}{S}+\frac{S v t}{S}\right)\left(\frac{S w e t}{S}\right) \mathrm{w} \\
\mathrm{~F}_{2}=\left(\frac{C D . o-F 1}{\frac{W}{S}}\right) \\
\mathrm{F}_{3}=\frac{K}{q 2}
\end{gathered}
$$

As we assumed the values from relevant aircrafts

$$
\begin{gathered}
\frac{S h t}{S}=0.29 \frac{S v t}{S}=0.21 \\
\mathrm{C}_{\mathrm{D} .0}=\mathrm{C}_{\mathrm{fe}}\left(\frac{S w e t}{S}\right)
\end{gathered}
$$

For equivalent tapered or trapezoidal wing with $0^{0}$ sweep

$$
\begin{gathered}
\mathrm{C}_{\mathrm{r}}=\mathrm{C}_{\mathrm{r}}-\left(\frac{C r-C t}{\frac{b}{2}}\right) \\
\mathrm{C}(\mathrm{y})=3.02-1.111 \mathrm{y}
\end{gathered}
$$

Taking fuselage diameter as 2.85 (based on similar aircraft's aisle height, width of seats \& no of seats in cabin)

The chord $\mathrm{y}=1.425 \mathrm{~m}$ is the root chord of exposed wing

$$
\mathrm{C}_{\mathrm{r}(\text { exposed })}=3.02-0.111(1.425)=2.86 \mathrm{~m}
$$

Semi span of exposed wing $b_{e}=\left(\frac{27.15}{2}\right)-\left(\frac{2.85}{2}\right)=12.15 \mathrm{~m}$

$$
\begin{gathered}
\left(\mathrm{S}_{\text {exp }}\right)_{\text {wing }}=\left(\frac{C r e x p+C t}{2}\right) * \frac{b e^{2}}{2} * \text { no of wings } \\
\left(\mathrm{S}_{\text {exp }}\right)_{\text {wing }}=\left(\frac{2.86+1.51}{2}\right) * 12.15 * 2=53.09 \mathrm{~m}^{2}
\end{gathered}
$$

Wetted area of exposed wing

$$
\mathrm{S}_{\mathrm{wet}}=2 * \mathrm{~S}_{\mathrm{ew}} *\left(1+1.2(\mathrm{t} / \mathrm{c})_{\mathrm{avg}}\right)
$$

$(\mathrm{t} / \mathrm{c})_{\text {avg }}$-average thickness to chord ratio

$$
\begin{gathered}
\mathrm{S}_{\text {wet }}=2 * 53.09^{*}(1+1.2(0.120))=121.46 \mathrm{~m}^{2} \\
\mathrm{C}_{\mathrm{D} . \mathrm{O}}=\mathrm{C}_{\mathrm{fe}}\left(\frac{S w e t}{S}\right) \quad \mathrm{C}_{\mathrm{fe}=} \text { skin friction drag } \\
\mathrm{C}_{\text {D. } \mathrm{O}}=0.00652\left(\frac{121.46}{61.43}\right)=0.01289
\end{gathered}
$$

$$
\mathrm{F}_{1}=1.5 * 0.005022=0.007533
$$

For straight wing aircraft ' $e$ ' (Oswald span efficiency $)=1.78\left(1-0.045 \mathrm{~A}^{0.68}\right)-0.64$
Here e=1.78(1-0.045(12) $\left.)^{0.68}\right)-0.64=1.120$

$$
\begin{gathered}
\mathrm{K}=\frac{1}{\pi A e} \\
\mathrm{~K}=\frac{1}{\pi * 12 * 1.120}=0.0236 \\
\left(\frac{L}{D}\right)_{\max }=16 \text { for turbo prop driven aircrafts } \\
\mathrm{C}_{\text {D. } 0}=1 / 4 \mathrm{~K}\left(\frac{L}{D}\right)^{2}{ }_{\max }=\frac{1}{4 * 0.0236 * 162}=0.0413
\end{gathered}
$$

$$
\begin{gathered}
\mathrm{C}_{\mathrm{D}}=0.0413+0.0236 \mathrm{C}_{\mathrm{L}}^{2} \\
\mathrm{C}_{\mathrm{fe}}=\frac{0.0413}{6.33}=0.00652 \\
\mathrm{~F}_{2}=\frac{0.0413-0.01289}{3433}=8.275 \times 10-6 \mathrm{~m}^{2} / \mathrm{N}
\end{gathered}
$$

The value depends on dynamic pressure at $\mathrm{V}_{\text {max }}$

$$
\mathrm{q}_{\max }=\frac{1}{2} \rho \mathrm{~V}_{\max }=0.5 * 0.364 * 157.1=3629.4 \quad\left(\mathrm{~V}_{\max }=0.404 * 389=157.1 \mathrm{~m} / \mathrm{s}\right)
$$

$$
\mathrm{F}_{3}=\frac{K}{q 2}=\frac{0.0236}{(3629.4) 2}=1.7910^{-9} \mathrm{~m}^{4} / \mathrm{N}^{2}
$$

The relation for the thrust required for $\mathrm{V}_{\max }$ is

$$
\begin{gathered}
\mathrm{T}_{\mathrm{vmax}}=\mathrm{q}_{\max }\left(\mathrm{F}_{1} / \mathrm{P}+\mathrm{F}_{2}+\mathrm{F}_{3} \mathrm{P}\right) \\
\left(\frac{W}{S}\right)_{\text {optimum }}=\overline{F_{F 3}}=\sqrt{0.007533 / 1.79 * 10^{-9}}=2068.8 \mathrm{~N} / \mathrm{m}^{2} \\
\mathrm{~T}_{\mathrm{V} \max }=3629.4\left(\left(\frac{0.007533}{2068.8}\right)+8.275 * 10^{-6} * 1.79 * 10^{-9} * 2068.8\right)=0.01321
\end{gathered}
$$

Minimum fuel for range ( $\mathbf{W}_{\text {fmin }}$ ) consideration:

$$
\begin{gathered}
\mathrm{W}_{\mathrm{fmin}}=\mathrm{R} / 3.6^{*} \frac{\rho}{2} * \mathrm{BSFC} \mathrm{q}_{\mathrm{cr}}\left(\mathrm{~F}_{1} / \mathrm{P}+\mathrm{F}_{2}+\mathrm{F}_{3} \mathrm{P}\right) \\
\text { Range } \mathrm{R}=2000 \& \mathrm{BSFC}=0.5 \mathrm{lb} /(\mathrm{lb} / \mathrm{hr}) \\
\mathrm{V}_{\mathrm{cr}}=108 \mathrm{~m} / \mathrm{s} \\
\mathrm{Q}_{\mathrm{cr}}=0.5 * 0.364 * 108^{2} \\
\mathrm{~F}_{3}=\frac{0.0236}{2123}=1.1116^{*} 10^{-5} \\
\mathrm{~F}_{1}=0.007533 \\
\mathrm{~F}_{2}=8.275^{*} 10^{-6} \mathrm{~m}^{2} / \mathrm{N} \\
\mathrm{P}_{\mathrm{optimum}}=2068.8 \mathrm{~N} / \mathrm{m}^{2}
\end{gathered}
$$

$$
\mathrm{W}_{\mathrm{f}}=\frac{2000}{3.6} * \quad \frac{0.346}{2} * 0.5 * \sqrt{2123} *\left(\frac{0.007533}{2068}+8.275 * 10^{-6} * 1.1116 * 10^{5} * 2068.8\right)
$$

$$
\mathrm{W}_{\mathrm{f}}=0.02040
$$

* Choice of wing loading is between $2068.8<\left(\frac{W}{S}\right)<2790 \mathrm{~N} / \mathrm{m}^{2}$

## Final choice of wing loading:

For final choice of wing loading, take-off requirements are considered
$\boxtimes$ High wing loading=shorter wing + low drag + low empty weight \& high thrust loading
$\square$ Low wing loading=large wing + more drag + more weight \& low thrust loading
We have assumed balanced field length of $1250 \mathrm{~m}=4101 \mathrm{ft}$, For this balanced field length take-off parameter is $\left(\frac{\frac{W}{S}}{\sigma \operatorname{CLTO}\left(\frac{B H P}{W}\right)}\right)$ is 150
$\sigma=1$ at sea level

$$
\mathrm{C}_{\mathrm{LTO}}=0.8 * 2.2 / 1.21=1.45
$$

$$
\begin{gathered}
\mathrm{BHP} / \mathrm{W}=550 \eta \mathrm{p} / \gamma(\mathrm{hp} / \mathrm{W})=\frac{550 \times 0.8}{354.3} \times 0.2=0.248 \\
140=\frac{\frac{W}{S}}{1 \times 1.45 \times 0.2} \\
\left(\frac{W}{S}\right)=44 \mathrm{lb} / \mathrm{ft}^{2}=2112.4 \mathrm{~nm}^{-2}
\end{gathered}
$$

## Thrust requirement for takeoff:

Typical value of $\left(\frac{h p}{W}\right)$ for twin turboprop is 0.2

$$
\mathrm{T}_{\mathrm{reqTO}}=0.2 * 20160 * 9.81=39553 \mathrm{~N}=40 \mathrm{KN}
$$

2015

Allowing more 25 KN as thrust requirement for $\mathrm{V}_{\text {max }}$

$$
\mathrm{T}_{\mathrm{req}}=65 \mathrm{KN}
$$

As we are using two turbo prop engines the requirement will be shared as

$$
\mathrm{T}_{\mathrm{req}}=32.5 \mathrm{KN} \text { for each engine }
$$

## Aircraft design parameters:

## Wing design:

Weight \& wing loading from the calculations are

$$
\begin{gathered}
\mathrm{W}=20160 \mathrm{kgf}(197568.6 \mathrm{~N}) \&\left(\frac{W}{S}\right)=2112.4 \mathrm{~N} / \mathrm{m}^{2}, \mathrm{~S}=\frac{197568}{2112.4}=93.53 \mathrm{~m}^{2} \\
\mathrm{Span} \mathrm{~b}=\sqrt{12 * 93.53}=33.5 \mathrm{~m}^{2}
\end{gathered}
$$

Root chord $\mathrm{C}_{\mathrm{r}}=\frac{2 * 93.53}{1+0.5 * 33.5}=3.72 \mathrm{~m}$

Tip chord $\mathrm{C}_{\mathrm{t}}=\mathrm{C}_{\mathrm{r}} \lambda=3.72 * 0.5=1.86$

Mean aerodynamic chord $(\mathrm{MAC})=\frac{2}{3} \frac{(1+\lambda+\lambda 2)}{1+\lambda}, \mathrm{MAC}=2 / 3\left(\frac{1.75}{1.5}\right) * 1.86=3.255 \mathrm{~m}$

## Fuselage layout:

From data $\frac{l f}{b}=0.84$ is considered
$\mathrm{L}_{\mathrm{f}}=0.84 * 33.5=28.14 \mathrm{~m}$

No seating classes are divided in this aircraft, all seats are economy class only

Depending on number of seats, aisle width, aisle height \& diameter of fuselage

- Nose length $=1 \mathrm{~m}$
- Cockpit length $=2.5 \mathrm{~m}$

ISSN: 2249-0558

- Cabin length $=15.2 \mathrm{~m}$
- Rear lengths $=10.2 \mathrm{~m}$

## Total $=\mathbf{2 8 . 1 4 m}$

Tail surface: We have assumed $\frac{S h t}{S}=0.29 \frac{S v t}{S}=0.21$

$$
\begin{gathered}
\mathrm{S}_{\mathrm{ht}}=0.29 * 93.5=27.1 \mathrm{~m}^{2} \\
\mathrm{~S}_{\mathrm{vt}}=0.21 * 93.5=19.6 \mathrm{~m}^{2} \\
\mathrm{~b}_{\mathrm{h}}=\sqrt{\mathrm{A}_{\mathrm{h}}} \mathrm{~S}_{\mathrm{h}} \sqrt{=5 * 2} 71=11.6 \mathrm{~m} \\
\mathrm{~b}_{\mathrm{v}}=\mathrm{A}_{\mathrm{V}} \mathrm{~S}_{\mathrm{V}} \neq 1.7 * 19.6=5.7 \mathrm{~m}
\end{gathered}
$$

Chord lengths

- $\mathrm{C}_{\mathrm{rh}}=\frac{2 S h}{b h(1+\lambda h)}=\frac{2 * 27.1}{11.6(1+1.5)}=3.1 \mathrm{~m} \quad \cdot \mathrm{C}_{\mathrm{th}}=3.1 * 0.5=1.55 \mathrm{~m}$
- $\mathrm{C}_{\mathrm{rv}}=\frac{2 S v}{b v(1+\lambda)}=2 * 19.6 / 5.7(1+0.31)=5.24 \mathrm{~m} \quad \mathrm{C}_{\mathrm{tv}}=5.24 * 0.31=1.62 \mathrm{~m}$

## Location of power plant:

Turboprop engines are located lower side of the wing with pylons to reduce drag \&fuel will be near. $34 \%$ of $\mathrm{b} / 2$ is the location to fix the engines.

Fig.4: Three view diagram of the aircraft

## Developing designs into CAD models:

CATIA (Computer Aided Three-dimensional Interactive Application) V5 R19 software was used to develop the CAD model.

Fig.5: CAD model of the aircraft

## RC Aircraft Design Measures:

In model aircraft design there are some critical measures that will play key role in flying. Those measures are the Static Margin (SM), Center of Gravity (CG), Horizontal Stabilizer Volume (VH), Vertical Stabilizer Volume (VV), and Cubic Wing Loading (CWL), Power-toWeight Ratio (P/W) or Thrust-to-Weight Ratio (T/W). In order to find these key measures we must first find a few other measures beforehand. These measures would be the dimensions and areas of the main wing, horizontal and vertical stabilizers, the aerodynamic centers (AC), Neutral Point (NP), and the distance between the two centers.

$$
\text { Wing area }=41\left(\frac{11+11}{2}\right)=41 * 11=451 \mathrm{~cm}^{2}
$$

$$
\text { Horizontal tail area }=13.25^{*}\left(\frac{7.8+4.3}{2}\right)=13.25^{*} 6.05=80.160 \mathrm{~cm}^{2}
$$

$$
\text { Vertical tail area }=15.5^{*}\left(\frac{9.5+8}{2}\right)=15.58 .75=135.6 \mathrm{~cm}^{2}
$$

Aerodynamic center for wing is at $\mathbf{2 . 8 c m}$ from leading edge.

Aerodynamic center for horizontal tail is at $\mathbf{2 . 1} \mathbf{c m}$ from leading edge.
Distance between AC \& NP, $\mathrm{D}=L *\left(\frac{\text { stab area }}{\text { wing area }+ \text { stab area }}\right)=42.7 *\left(\frac{80.16}{451+80.16}\right)=6.45 \mathrm{~cm}$

## Static Margin:

The Static Margin is a measure of stability of your plane. Most planes have a SM of 5\% to $15 \%$ of the MAC which means the CG is $5 \%$ MAC to $15 \%$ MAC in front of the NP.

$$
\text { Static } \operatorname{Margin}(S M)=\frac{M A C}{\sim 10}=\frac{11.2}{10}=1.12 \mathrm{~cm}
$$

We can now use D to find the location of NP by subtracting it from L .

## Conclusion:

Preliminary design procedure was worked out on a regional class aircraft with all predefined requirements that are meant to be fulfilled by every aircraft with in that class. The advancements in aerodynamically structured aircraft made aviation more efficient than before. By preliminary design parameters CAD model of the aircraft is developed in CATIA V5 R19 software. Radio controlled aircraft is developed by the classic aero modeling theory and aerodynamic calculations and the plan was worked out on extruded polyurethane foam boards. Mean aerodynamic chords, neutral point, center of gravity etc. calculations are well defined that makes neither nose heavy nor tail, thus aircraft balances perfectly.
